Climate Trends in Connecticut and Its Impact on Storm and Riverine Flood Behavior

David R. Vallee
Hydrologist-in-Charge
NOAA/NWS Northeast River Forecast Center
Connecticut Association of Conservation & Inland Wetlands Commissions
41st Annual Meeting & Environmental Conference
Outline

• From a “Practitioner’s Perspective”
• Touch upon some of our major flood events of the past 10 years
  • Part I: Big Rainstorms & High Impact Floods
  • Part II: Coastal Storms & Sea Level Rise
• How may a changing climate be impacting flood behavior
  • “Accumulation of Ingredients” – not one single “source”
• The challenge ahead of us?
River Forecast Center Responsibilities

Calibrate and implement a variety of hydrologic and hydraulic models to provide:

- River flow and stage forecasts at 180 locations
- Guidance on the rainfall needed to produce Flash Flooding
- Ensemble streamflow predictions
- Ice Jam and Dam Break support
- Water Supply forecasts
- Partner with NOAA Line Offices to address issues relating to Hazard Resiliency, Water Resource Services, Ecosystem Health and Management, and Climate Change

Moderate flooding - Connecticut River at Portland, CT.
A Look At Current & Future Water Prediction Services:

Moving from Point Specific to Street Level Hydrologic Forecasting

New services to include the Hydrologic Ensemble Prediction System & the new National Water Model
Building a Weather-Ready Nation

Hydro-Blind location

500 people trapped at Elkview mall

Experimental NWM Local Inundation Map

- Thousands of homes damaged or destroyed, $111+ million in FEMA aid
- NWM allows users to drill down from regional to local to street scale
- Information complements hydrologic guidance at existing forecast locations and provides new insight at millions of hydro-blind locations

NWM Street-Level Forecast Streamflow (cfs)

Bridge Collapse

Hydro-Blind location

A warming planet and shrinking Arctic Sea ice

**September Minimum Sea Ice Cover 1979-2016**

This graph shows the average area covered by sea ice during September each year. Minimum sea ice extent has decreased 12% per decade since 1979. Data provided by the National Snow and Ice Data Center.

**2016 Arctic Sea Ice Summer Minimum**

Arctic sea ice concentration on the date of the 2016 minimum extent, September 10, 2016. NOAA Climate.gov image based on NOAA and NASA satellite data from NSIDC.
Is there a common theme to recent floods?

- Several:
  - Slow moving weather systems – a blocked up atmosphere
    - Related to loss of artic ice cover
    - Multiple events in close succession or one big slow moving storm
  - Results in saturated antecedent conditions before “main event”
  - Each fed by a “tropical connection”
    - Plumes of deep moisture
The Changing Climate

- **Common themes in Connecticut:**
  - Significant warming trend in annual temperatures
  - Increasing annual precipitation
  - Increasing frequency of heavy rains
  - Increased variability between dry and wet extremes
  - Shift in precipitation frequency

- **Trend toward increased flood magnitude and/or frequency**
  - Most pronounced where significant land use change and/or urbanization has occurred
  - More pronounced in smaller river basins and basins without flood control reservoirs

Residents are rescued from their homes by boat along flooded Pawcatuck River, Westerly RI, on March 30, 2010. Photo: www.theday.com

Major flooding along Route 7 from the Housatonic River in New Milford, CT on March 11, 2011. Source: Ctcameraeye.com
A Look at Temperature Trends

http://www.ncdc.noaa.gov/cag

The number of degrees that a day’s average temperature is below 65°F (18°C), the temperature below which buildings need to be heated.

The number of degrees that a day’s average temperature is above 65°F Fahrenheit and people start to use air conditioning to cool their buildings.
A Look at Precipitation Trends

http://www.ncdc.noaa.gov/cag

Connecticut, Precipitation, January-December

1930-2017 Mean: 47.29"  1930-2017 Trend +0.37"/Decade

+1 inch / 27 yrs
Much of southern NE experienced a 1 to 2 inch upward shift!

Thick yellow lines represent 24 hr 100 yr values from TP-40, 1961

http://hdsc.nws.noaa.gov/hdsc/pfds/index.html
...But you cannot design for everything!
Example: August 13th, 2014 – Islip, NY – Rainfall 11 inches/3 hours

Westport firefighters rescued two adults and two children from vehicles that were swept off the road by floodwaters. Crews had to break a window to extricate one victim, but no injuries were reported. Photo credit: Town of Westport Fire Department
Since the late 60s, signature of less frequent & shorter dry periods and longer, more frequent and intense wet periods
Trends in Flood Frequency:
*Smaller watersheds feeling the effects first*

- Changes in frequency/magnitude
- Part land use/urbanization
  - Compounded by encroachment in the floodplain
- Part changing climate
- Larger basins & those with flood control haven’t seen as noticeable a shift
  - Greater capacity to handle more rain
  - Greater capacity to control releases
- Northern and western parts of the state are seeing the most dramatic increase in flooding
  - Same area where 100 year rainfall has shifted dramatically
2009 study of 28 watersheds with minimal human influences
- Results indicate basins have experienced increased peak annual flows
  - Strongest statistical trends noted by the large blue triangles

2011 study of 23 watersheds with minimal human influences
- Examined peaks over defined thresholds per water year
- More frequent flooding at 22 of 23 locations
- Increasing flood magnitude at 17 of 23 locations

Spatial distribution of trend directions & magnitudes for based with minimal human influences.

Spatial Distribution of Flood Frequency – as measured by peaks over threshold per water year.
Southern New England River Basin Percent Increase (+)/Decrease (-) in Minor, Moderate, and Major Floods Per Year Pre 1970 vs. 1970+
Common themes across New England and Connecticut:
- Warming annual temperatures
- Increasing annual precipitation
  - Large swings in extremes (wet & dry)
- Increasing frequency of heavy rains
- Shift in precipitation frequency

Trend toward increased flood magnitude and/or frequency
- Most pronounced where significant land use change and/or urbanization has occurred
- More pronounced in smaller river basins

Residents are rescued from their homes by boat along flooded Pawcatuck River, Westerly RI, on March 30, 2010. Photo: www.theday.com

Major flooding along Route 7 from the Housatonic River in New Milford, CT on March 11, 2011. Source: Ctcameraeye.com
Part II: Coastal Impacts
Consider The 2011 and 2012 Seasons:

- **Irene:** Widespread wind damage & power disruption in the east & devastating flooding rains in the west
  - “It’s all about the wind and rain!”

- **Sandy:** Significant coastal flooding but with less wind and little if any rain
  - “It’s all about the coastal flooding!”
Sandy: A Perfect Storm of Sorts

- Formed in the western Caribbean
  - Not at all unusual for late October

- Encountered a very deep trough of Low Pressure in the eastern United States and very strong High Pressure moving southward from the Canadian Maritimes
  - A winter-type dual jet stream set up (classic for a New England Hurricane)
  - Captured Sandy & blocked her attempt to race out to sea
Long Duration Southeast Fetch

*Damaging Waves, Multiple Tide Cycles & a 4-8 ft Storm Surge*

Southeast swells built on 2 days of southeast winds were driven right into the south coast & Long Island Sound

- Impacted Multiple Tide Cycles – worst of which was Monday night
- 15-30 foot seas resulted in relentless pounding surf which first weakened then obliterated the dunes along parts of the exposed coast
- Storm surge of 4-8 feet atop a “middle-of-the-road” astronomical tide produced significant coastal flooding and inundation 4 to 7 feet above ground level
- What she lacked in intensity she made up for in duration!
Sea Level Trends

http://tidesandcurrents.noaa.gov/sltrends/index.shtml

The map above illustrates regional trends in sea level, with arrows representing the direction and magnitude of change. Click on an arrow to access additional information about that station.

Sea Level Trends

mm/yr (feet/century)

- Gray: 15 to 21 (5 to 7)
- Orange: 6 to 9 (2 to 3)
- Red: 3 to 6 (1 to 2)
- Green: 0 to 3 (0 to 1)
- Blue: -3 to 0 (-1 to 0)
- Light Blue: -6 to -3 (-2 to -1)
- Light Green: -9 to -6 (-3 to -2)
- Black: -12 to -9 (-4 to -3)
- Dark Blue: -15 to -12 (-5 to -4)
- Brown: -18 to -15 (-6 to -5)
The mean sea level trend is 2.87 millimeters/year with a 95% confidence interval of +/- 0.44 mm/yr based on monthly mean sea level data from 1964 to 2014 which is equivalent to a change of 0.91 feet in 100 years.
The mean sea level trend is 2.58 millimeters/year with a 95% confidence interval of +/- 0.23 mm/yr based on monthly mean sea level data from 1938 to 2014 which is equivalent to a change of 0.85 feet in 100 years.
Tropical Storm Irene’s Coastal Damage

- Significant damage across western Connecticut coastline
  - Significant coastal flooding – from a 3 to 6 foot storm surge
  - Seventeen highway bridges destroyed by rampaging waters
  - Rockslides blocked dozens of other roadways
  - New Haven Rail Line reported 24 washouts, six landslides, one 5-car derailment

Photos courtesy of C. Zuraw, CT Post

Cosey Beach, East Haven, Connecticut
Photo courtesy of TWC/Storify
Hurricane Sandy’s Coastal Damage

- Large damaging waves over multiple tide cycles
- Highest tide coincides with highest onshore winds
- Sends storm surge of several feet up the coastal rivers

Milford, Connecticut

Plum Bank Road, Old Saybrook
Photo: Stephen Dunn/Hartford Courant

Milford, Connecticut
Photo: CNN
The Northeast U.S. has become a “hot spot” for record floods & heavy rainfall in the past 20 years
- Noticeable trends include increased yearly rainfall and increased annual temperatures
- Smaller watersheds & those with significant urbanization and/or land use change are most vulnerable to increased river & stream flooding
- Continued sea level rise combined with intense coastal storms has renewed the coastal flood threat
  - A weaker category of storm is now capable of producing inundation once limited to the more intense hurricanes and coastal storms
Far reaching implications: **Protect, Adapt or Retreat??**

- Floodplain, land use, infrastructure, dam spillway requirements, drainage requirements, storm water management, non-point source runoff, bridge clearances, “hardening” of critical facilities in the floodplain, property values etc...
- Flood Insurance – work to increase participation
- How much risk are we willing to insure and accept?

---

**Graphic courtesy of Cameron Wake**

 Universität of New Hampshire
Land Trusts can help to:

- Preserve the land
- Retain and restore grounds to their natural state
- Increase rainfall/runoff storage capacity of a given parcel of land
- Improve water quality through restoration of lands and vegetation to a more natural state
- Reduce storm water runoff
Smart Building Approaches
Smart Building Approaches

Concept: Refurbish old textile mill into apartments
Challenge: Flood-prone area on the Pawtuxet River
Plan: Critical infrastructure located on floors 2 and above
Lowest levels used for parking so can be cleared out during a flood...which happened in March 2010!
Chelsea Screen house
Assessing Vulnerability and Taking Mitigating Actions
Elevating Critical Infrastructure

Slide courtesy of Lise Marx, Senior Program Manager, Master Planning Massachusetts Water Resources Agency (MWRA)
Using Green Technology: Bioswales

- Stormwater runoff best management practice
- Receives and slows runoff generated during small to medium sized storms
- Provides modest local flood storage
- Filters, traps and removes contaminants in stormwater runoff that would otherwise be carried downstream.
Porous pavement

- Another best practice
- Reduces risk for ice formation on parking lots and walkways
- Slows arrival of stormwater into near by catchments
- Depending upon design, can also act as a filter mechanism
Climate Trends in Connecticut and Its Impact on Storm and Riverine Flood Behavior

Flooding along the Housatonic River following Lee, Sept 8, 2011.
